

## WHAT IS AVA RFID MANAGER™?

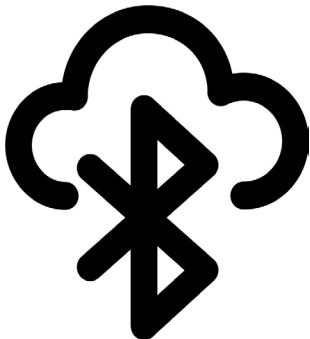

AVA RFID Manager is a solution that upgrades AVA Asset Manager, AVA Item Manager or existing legacy systems to utilize RFID technology. Various RFID tag standards are supported, including EPC Gen2 and Low-Energy Bluetooth (LEB). Tags are used for access control, in supply chain management, to track inventory movement, files, garments, equipment assets, people, and high cost/loss items such as electronics or tools.

## SOLUTION OPTIONS

### LOW-ENERGY BLUETOOTH SOLUTION

A Real-Time Location System (RTLS) that tells you exactly where an asset is in real time, with tracking distances up to 300 feet. Low Energy Bluetooth tags can also remotely disclose physical and environmental conditions, such as location and temperature and account for adults or children within a defined population or area.

### PASSIVE RFID SOLUTION

A solution that gives companies the ability to track inventory using passive RFID (pRFID) tags. Passive RFID is used to track receiving and shipping of all assets coming in and out of a warehouse or defined location. Passive RFID range is within 8-12 feet.
